

STA013 STA013B STA013T

MPEG 2.5 LAYER III AUDIO DECODER

- SINGLE CHIP MPEG2 LAYER 3 DECODER SUPPORTING:
 - All features specified for Layer III in ISO/IEC 11172-3 (MPEG 1 Audio)
 - All features specified for Layer III in ISO/IEC 13818-3.2 (MPEG 2 Audio)
 - Lower sampling frequencies syntax extension, (not specified by ISO) called MPEG 2.5
- DECODES LAYER III STEREO CHANNELS, DUAL CHANNEL, SINGLE CHANNEL (MONO)
- SUPPORTING ALL THE MPEG 1 & 2 SAMPLING FREQUENCIES AND THE EXTENSION TO MPEG 2.5:
48, 44.1, 32, 24, 22.05, 16, 12, 11.025, 8 KHz
- ACCEPTS MPEG 2.5 LAYER III ELEMENTARY COMPRESSED BITSTREAM WITH DATA RATE FROM 8 Kbit/s UP TO 320 Kbit/s
- DIGITAL VOLUME CONTROL
- DIGITAL BASS & TREBLE CONTROL
- SERIAL BITSTREAM INPUT INTERFACE
- ANCILLARY DATA EXTRACTION VIA I2C INTERFACE.
- SERIAL PCM OUTPUT INTERFACE (I²S AND OTHER FORMATS)
- PLL FOR INTERNAL CLOCK AND FOR OUTPUT PCM CLOCK GENERATION
- LOW POWER CONSUMPTION:
85mW AT 2.4V
- CRC CHECK AND SYNCHRONISATION ERROR DETECTION WITH SOFTWARE INDICATORS
- I²C CONTROL BUS
- LOW POWER 3.3V CMOS TECHNOLOGY
- 10 MHz, 14.31818 MHz, OR 14.7456 MHz EXTERNAL INPUT CLOCK OR BUILT-IN INDUSTRY STANDARD XTAL OSCILLATOR
DIFFERENT FREQUENCIES MAY BE SUPPORTED UPON REQUEST TO STM

APPLICATIONS

- PC SOUND CARDS
- MULTIMEDIA PLAYERS

SO28

TQFP44

LFBGA64

ORDERING NUMBERS: STA013\$ (SO28)
STA013T\$ (TQFP44)
STA013B\$ (LFBGA 8x8)

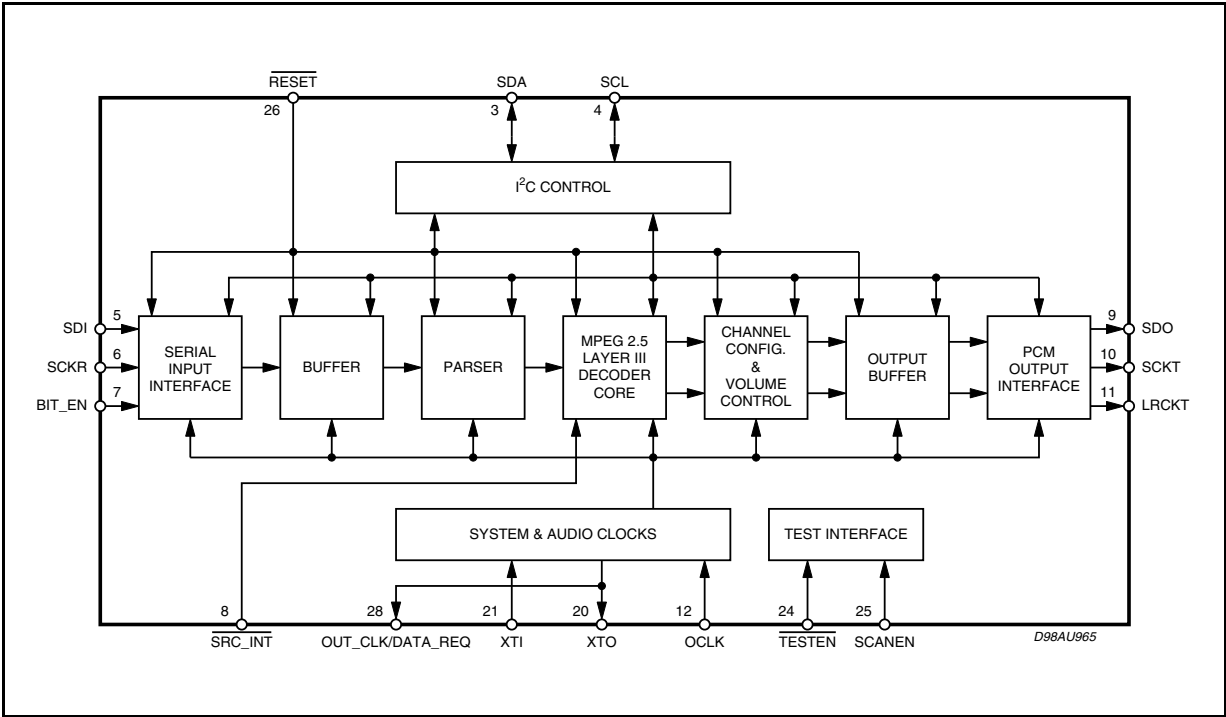

DESCRIPTION

The STA013 is a fully integrated high flexibility MPEG Layer III Audio Decoder, capable of decoding Layer III compressed elementary streams, as specified in MPEG 1 and MPEG 2 ISO standards. The device decodes also elementary streams compressed by using low sampling rates, as specified by MPEG 2.5.

STA013 receives the input data through a Serial Input Interface. The decoded signal is a stereo, mono, or dual channel digital output that can be sent directly to a D/A converter, by the PCM Output Interface. This interface is software programmable to adapt the STA013 digital output to the most common DACs architectures used on the market.

The functional STA013 chip partitioning is described in Fig.1.

Figure 1. Block Diagram: MPEG 2.5 Layer III Decoder Hardware Partitioning.

THERMAL DATA

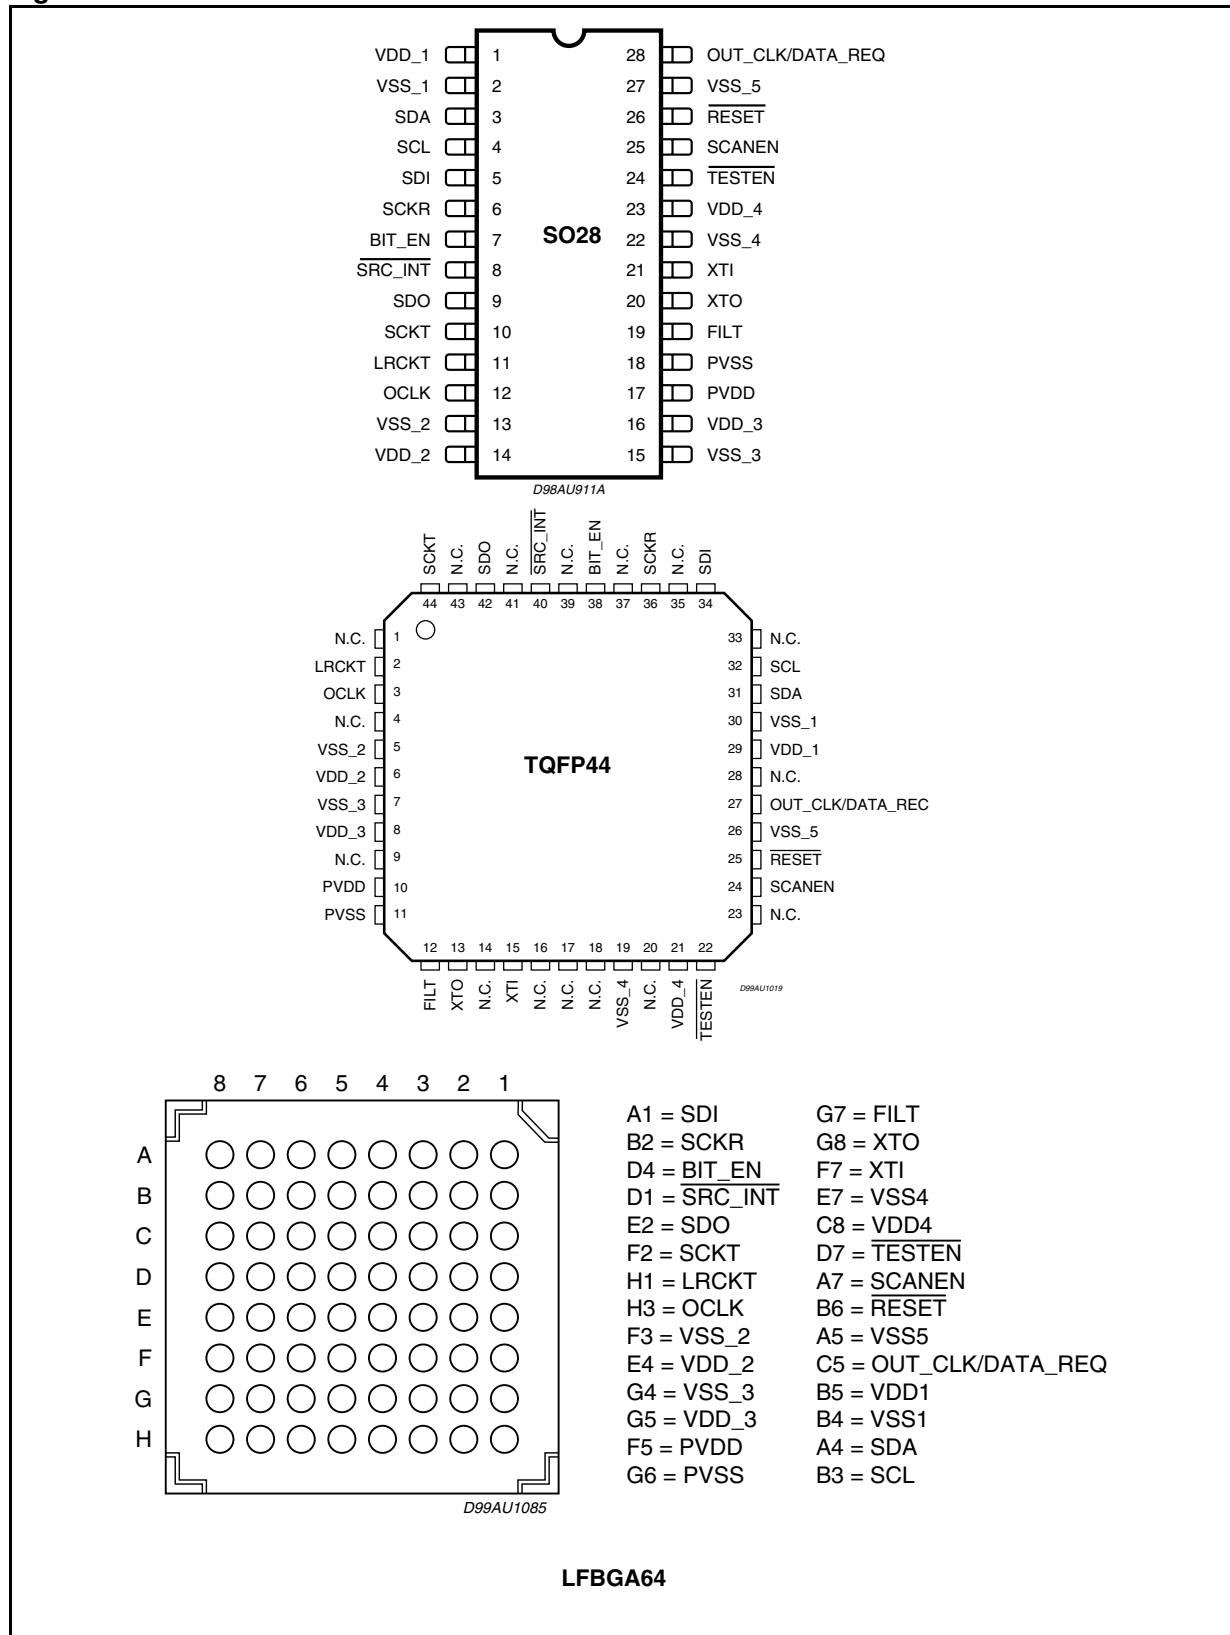

Symbol	Parameter	Value	Unit
R _{th j-amb}	Thermal resistance Junction to Ambient	85	°C/W

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V _{DD}	Power Supply	-0.3 to 4	V

20	13	G8	XTO	O	Crystal Output	CMOS 4mA Output Drive
21	15	F7	XTI	I	Crystal Input (Clock Input)	Specific Level Input Pad (see paragraph 2.1)
22	19	E7	VSS_4		Ground	
23	21	C8	VDD_4		Supply Voltage	
24	22	D7	$\overline{\text{TESTEN}}$	I	Test Enable	CMOS Input Pad Buffer with pull up
25	24	A7	SCANEN	I	Scan Enable	CMOS Input Pad Buffer
26	25	B6	$\overline{\text{RESET}}$	I	System Reset	CMOS Input Pad Buffer with pull up
27	26	A5	VSS_5		Ground	
28	27	C5	OUT_CLK/ DATA_REQ	O	Buffered Output Clock/ Data Request Signal	CMOS 4mA Output Drive

Note: SRC_INT signal is used by STA013 internal software in Broadcast Mode only; in Multimedia mode SRC_INT must be connected to V_{DD}. In functional mode TESTEN must be connected to VDD, SCANEN to ground.

1. ELECTRICAL CHARACTERISTICS: $V_{DD} = 2.7V \pm 0.3V$; $T_{amb} = 0$ to $70^{\circ}C$; $R_g = 50\Omega$ unless otherwise specified

DC OPERATING CONDITIONS

Symbol	Parameter	Value
V_{DD}	Power Supply Voltage	2.4 to 3.6V

GENERAL INTERFACE ELECTRICAL CHARACTERISTICS

Symbol	Parameter	Test Condition	Min.	Typ.	Max.	Unit	Note
I_{IL}	Low Level Input Current Without pull-up device	$V_i = 0V$	-10		10	μA	1
I_{IH}	High Level Input Current Without pull-up device	$V_i = V_{DD} = 3.6V$	-10		10	μA	1
V_{esd}	Electrostatic Protection	Leakage $< 1\mu A$	2000			V	2

Note 1: The leakage currents are generally very small, $< 1nA$. The value given here is a maximum that can occur after an electrostatic stress on the pin.

Note 2: Human Body Model.

DC ELECTRICAL CHARACTERISTICS

Symbol	Parameter	Test Condition	Min.	Typ.	Max.	Unit	Note
V_{IL}	Low Level Input Voltage				$0.2 \cdot V_{DD}$	V	
V_{IH}	High Level Input Voltage		$0.8 \cdot V_{DD}$			V	
V_{OL}	Low Level Output Voltage	$I_{OL} = Xma$			0.4V	V	1, 2
V_{OH}	High Level Output Voltage		$0.85 \cdot V_{DD}$			V	1, 2

Note 1: Takes into account 200mV voltage drop in both supply lines.

Note 2: X is the source/sink current under worst case conditions and is reflected in the name of the I/O cell according to the drive capability.

Symbol	Parameter	Test Condition	Min.	Typ.	Max.	Unit	Note
I_{PU}	Pull-up current	$V_i = 0V$; pin numbers 7, 24 and 26; $V_{DD} = 3V$	-25	-66	-125	μA	1
R_{PU}	Equivalent Pull-up Resistance			50		$k\Omega$	

Note 1: Min. condition: $V_{DD} = 2.4V$, $125^{\circ}C$ Min process

Max. condition: $V_{DD} = 3.6V$, $-20^{\circ}C$ Max.

POWER DISSIPATION

Symbol	Parameter	Test Condition	Min.	Typ.	Max.	Unit	Note
PD	Power Dissipation @ $V_{DD} = 3V$	Sampling_freq ≤ 24 kHz		76		mW	
		Sampling_freq ≤ 32 kHz		79		mW	
		Sampling_freq ≤ 48 kHz		85		mW	

Figure 3. Test Circuit

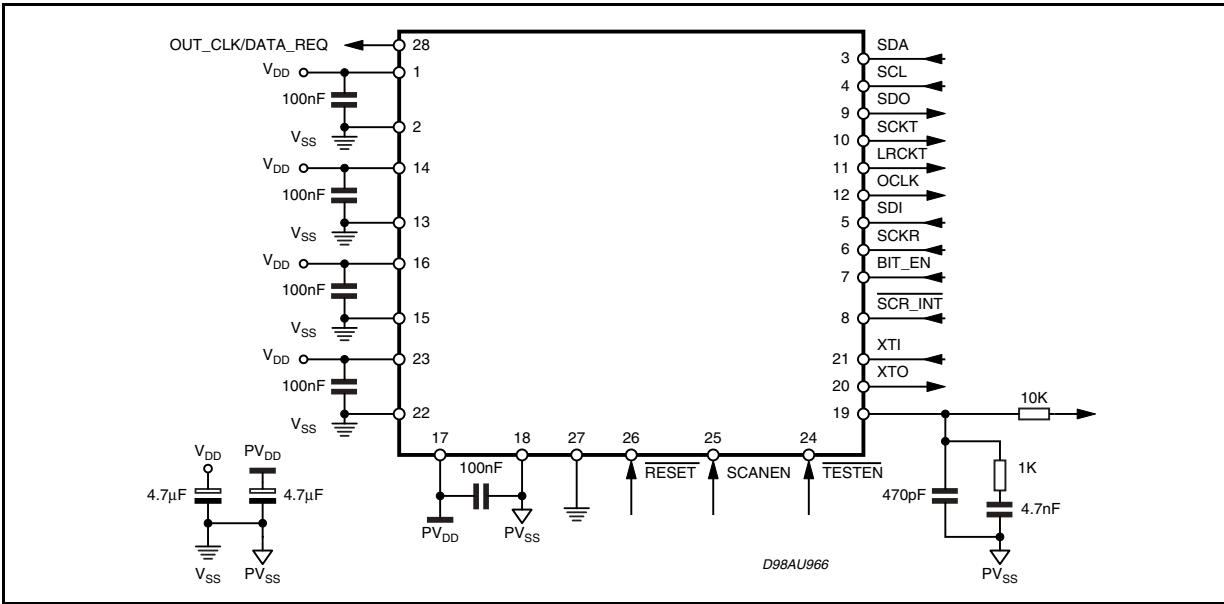

Figure 4. Test Load Circuit

Test Load

Output	I _{OL}	I _{OH}	C _L	V _{REF}
SDA	1mA		100pF	3.6V
Other Outputs	100μA	100μA	100pF	1.5V

2. FUNCTIONAL DESCRIPTION

2.1 - Clock Signal

The STA013 input clock is derived from an external source or from a industry standard crystal oscillator, generating input frequencies of 10, 14.31818 or 14.7456 MHz.

Other frequencies may be supported upon request to STMicroelectronics. Each frequency is supported by downloading a specific configuration file, provided by STM

XTI is an input Pad with specific levels.

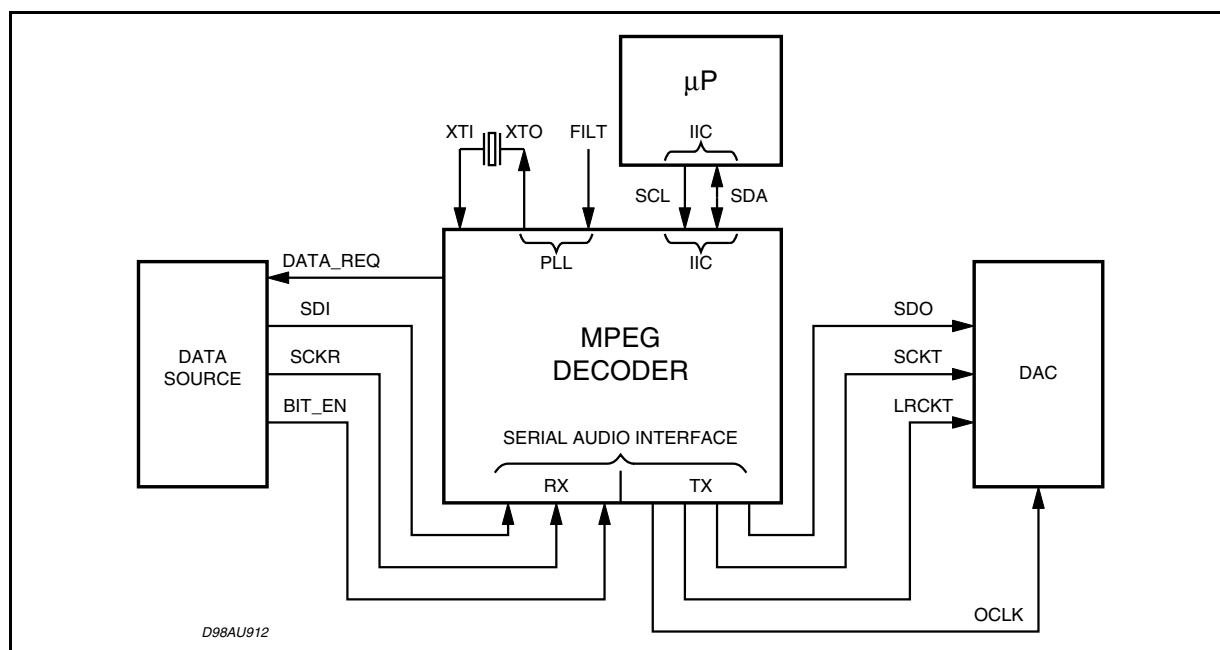

Symbol	Parameter	Test Condition	Min.	Typ.	Max.	Unit
V _{IL}	Low Level Input Voltage				V _{DD} -1.8	V
V _{IH}	High Level Input Voltage		V _{DD} -0.8			V

CMOS compatibility

The XTI pad low and high levels are CMOS compatible; XTI pad noise margin is better than typical CMOS pads.

TTL compatibility

The XTI pad low level is compatible with TTL while the high level is not compatible (for example if V_{DD} = 3V TTL min high level = 2.0V while XTI min high level = 2.2V)

Figure 5. MPEG Decoder Interfaces.**Figure 6.** Serial Input Interface Clocks

2.2 - Serial Input Interface

STA013 receives the input data (MSB first) through the Serial Input Interface (Fig.5). It is a serial communication interface connected to the SDI (Serial Data Input) and SCKR (Receiver Serial Clock).

The interface can be configured to receive data sampled on both rising and falling edge of the SCKR clock.

The BIT_EN pin, when set to low, forces the bit-stream input interface to ignore the incoming data. For proper operation Bit-EN line should be toggled only when SCKR is stable low (for both SCLK_POL configuration). The possible configurations are described in Fig. 6.

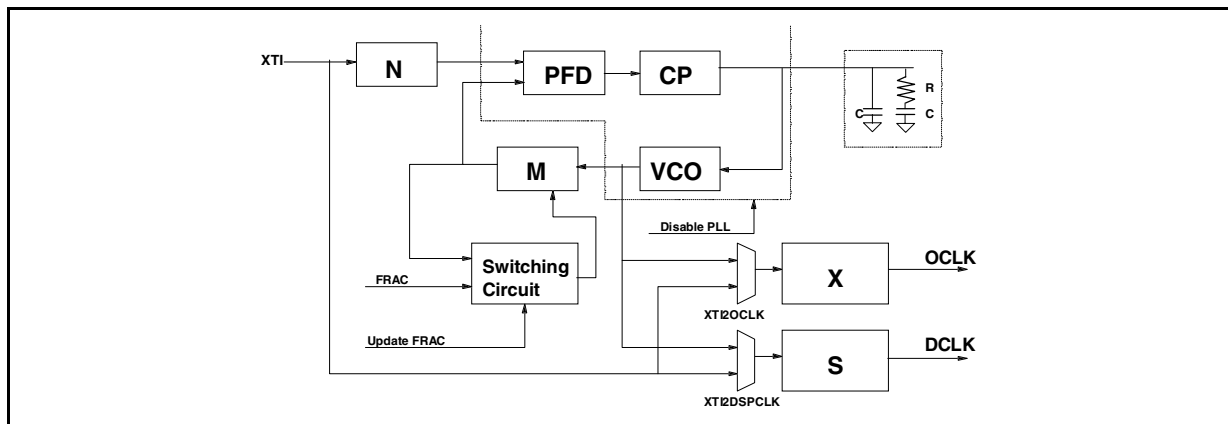

2.3 - PLL & Clock Generator System

When STA013 receives the input clock, as described in Section 2.1, and a valid layer III input bit stream, the internal PLL locks, providing to the DSP Core the master clock (DCLK), and to the Audio Output Interface the nominal frequencies of the incoming compressed bit stream. The STA013 PLL block diagram is described in Figure 7.

The audio sample rates are obtained dividing the oversampling clock (OCLK) by software programmable factors. The operation is done by STA013 embedded software and it is transparent to the user.

The STA013 PLL can drive directly most of the commercial DACs families, providing an oversampling clock, OCLK, obtained dividing the VCO frequency with a software programmable dividers.

Figure 7. PLL and Clocks Generation System

2.4 - PCM Output Interface

The decoded audio data are output in serial PCM format. The interface consists of the following signals:

SDO PCM Serial Data Output
SCKT PCM Serial Clock Output
LRCLK Left/Right Channel Selection Clock
The output samples precision is selectable from

16 to 24 bits/word, by setting the output precision with PCMCONF (16, 18, 20 and 24 bits mode) register. Data can be output either with the most significant bit first (MS) or least significant bit first (LS), selected by writing into a flag of the PCMCONF register.

Figure 8 gives a description of the several STA013 PCM Output Formats.

The sample rates set decoded by STA013 is described in Table 1.

Figure 8. PCM Output Formats

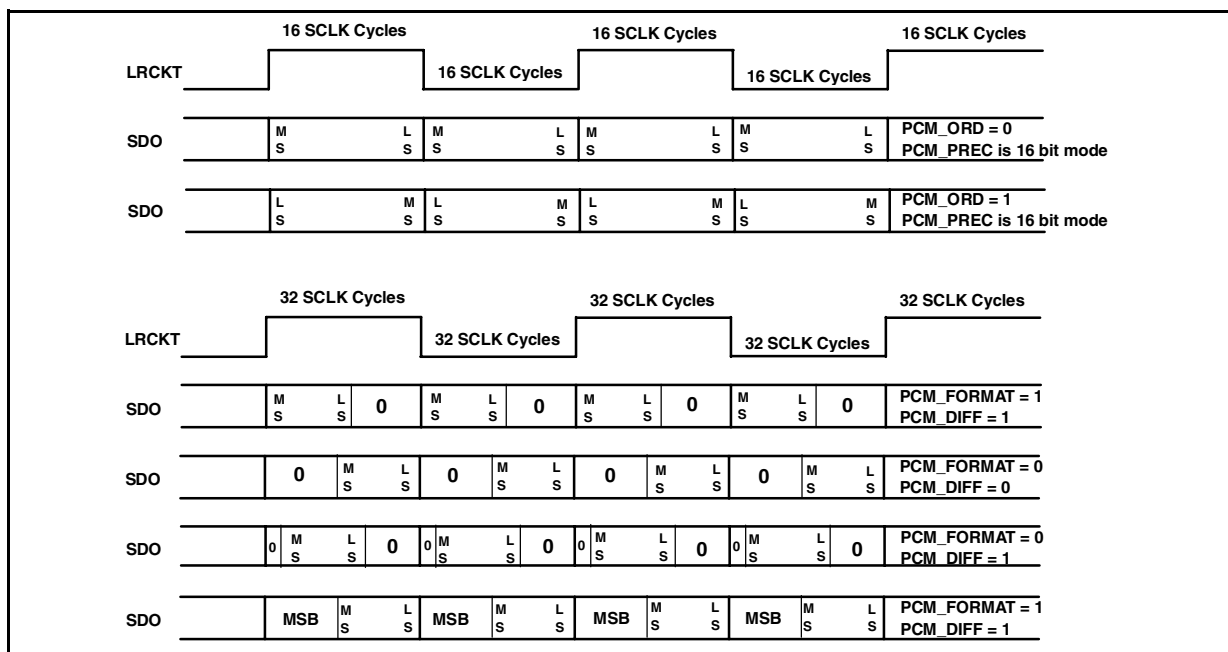

Table 1: MPEG Sampling Rates (KHz)

MPEG 1	MPEG 2	MPEG 2.5
48	24	12
44.1	22.05	11.025
32	16	8

2.5 - STA013 Operation Mode

The STA013 can work in two different modes, called Multimedia Mode and Broadcast Mode.

In **Multimedia Mode**, STA013 decodes the incoming bitstream, acting as a master of the data communication from the source to itself.

This control is done by a specific buffer management, controlled by STA013 embedded software.

The data source, by monitoring the DATA_REQ line, send to STA013 the input data, when the signal is high (default configuration).

The communication is stopped when the DATA_REQ line is low.

In this mode the fractional part of the PLL is disabled and the audio clocks are generated at nominal rates. Fig. 9 describes the default DATA_REQ signal behaviour.

Programming STA013 it is possible to invert the polarity of the DATA_REQ line (register REQ_POL).

Figure 9.

In **Broadcast Mode**, STA013 works receiving a bitstream with the input speed regulated by the source. In this configuration the source has to guarantee that the bitrate is equivalent to the nominal bitrate of the decoded stream.

To compensate the difference between the nominal and the real sampling rates, the STA013 embedded software controls the fractional PLL operation. Portable or Mobile applications need normally to operate in Broadcast Mode. In both modes the MPEG Synchronisation is automatic and transparent to the user. To operate in Multimedia mode, the STA013, pin nr. 8, SCR-INT must be connected to VDD on the application board.

2.6 - STA013 Decoding States

There are three different decoder states: **Idle**, **Init**, and **Decode**. Commands to change the decoding states are described in the STA013 I²C registers description.

Idle Mode

In this mode the decoder is waiting for the RUN command. This mode should be used to initialise

the configuration register of the device. The DAC connected to STA013 can be initialised during this mode (set MUTE to 1).

PLAY	MUTE	Clock State	PCM Output
X	0	Not Running	0
X	1	Running	0

Init Mode

"PLAY" and "MUTE" changes are ignored in this mode. The internal state of the decoder will be updated only when the decoder changes from the state "init" to the state "decode". The "init" phase ends when the first decoded samples are at the output stage of the device.

Decode Mode

This mode is completely described by the following table:

PLAY	MUTE	Clock State	PCM Output	Decoding
0	0	Not Running	0	No
0	1	Running	0	No
1	0	Running	Decoded Samples	Yes
1	1	Running	0	Yes

3 - I²C BUS SPECIFICATION

The STA013 supports the I²C protocol. This protocol defines any device that sends data on to the bus as a transmitter and any device that reads the data as a receiver. The device that controls the data transfer is known as the master and the others as the slave. The master always starts the transfer and provides the serial clock for synchronisation. The STA013 is always a slave device in all its communications.

3.1 - COMMUNICATION PROTOCOL

3.1.0 - Data transition or change

Data changes on the SDA line must only occur when the SCL clock is low. SDA transition while the clock is high are used to identify START or STOP condition.

3.1.1 - Start condition

START is identified by a high to low transition of the data bus SDA signal while the clock signal SCL is stable in the high state.

A START condition must precede any command for data transfer.

3.1.2 - Stop condition

STOP is identified by low to high transition of the data bus SDA signal while the clock signal SCL is stable in the high state. A STOP condition terminates communications between STA013 and the bus master.

3.1.3 - Acknowledge bit

An acknowledge bit is used to indicate a successful data transfer. The bus transmitter, either master or slave, releases the SDA bus after sending 8 bit of data.

During the 9th clock pulse the receiver pulls the SDA bus low to acknowledge the receipt of 8 bits of data.

3.1.4 - Data input

During the data input the STA013 samples the SDA signal on the rising edge of the clock SCL.

For correct device operation the SDA signal has to be stable during the rising edge of the clock and the data can change only when the SCL line is low.

3.2 - DEVICE ADDRESSING

To start communication between the master and the STA013, the master must initiate with a start condition. Following this, the master sends onto the SDA line 8 bits (MSB first) corresponding to the device select address and read or write mode.

The 7 most significant bits are the device address identifier, corresponding to the I²C bus definition. For the STA013 these are fixed as 1000011.

The 8th bit (LSB) is the read or write operation RW, this bit is set to 1 in read mode and 0 for write mode. After a START condition the STA013 identifies on the bus the device address and, if a match is found, it acknowledges the identification on SDA bus during the 9th bit time. The following byte after the device identification byte is the internal space address.

3.3 - WRITE OPERATION (see fig. 10)

Following a START condition the master sends a device select code with the RW bit set to 0.

The STA013 acknowledges this and waits for the byte of internal address.

After receiving the internal bytes address the STA013 again responds with an acknowledge.

3.3.1 - Byte write

In the byte write mode the master sends one data byte, this is acknowledged by STA013. The master then terminates the transfer by generating a STOP condition.

3.3.2 - Multibyte write

The multibyte write mode can start from any internal address. The transfer is terminated by the master generating a STOP condition.

Figure 10. Write Mode Sequence

Figure 11. Read Mode Sequence

3.4 - READ OPERATION (see Fig. 11)

3.4.1 - Current byte address read

The STA013 has an internal byte address counter. Each time a byte is written or read, this counter is incremented.

For the current byte address read mode, following a START condition the master sends the device address with the RW bit set to 1.

The STA013 acknowledges this and outputs the byte addressed by the internal byte address counter. The master does not acknowledge the received byte, but terminates the transfer with a STOP condition.

3.4.2 - Sequential address read

This mode can be initiated with either a current address read or a random address read. However in this case the master does acknowledge the data byte output and the STA013 continues to output the next byte in sequence.

To terminate the streams of bytes the master does not acknowledge the last received byte, but

terminates the transfer with a STOP condition.

The output data stream is from consecutive byte addresses, with the internal byte address counter automatically incremented after one byte output.

4 - I²C REGISTERS

The following table gives a description of the MPEG Source Decoder (STA013) register list.

The first column (HEX_COD) is the hexadecimal code for the sub-address.

The second column (DEC_COD) is the decimal code.

The third column (DESCRIPTION) is the description of the information contained in the register.

The fourth column (RESET) indicate the reset value if any. When no reset value is specified, the default is "undefined".

The fifth column (R/W) is the flag to distinguish register "read only" and "read and write", and the useful size of the register itself.

Each register is 8 bit wide. The master shall operate reading or writing on 8 bits only.

I²C REGISTERS

HEX_COD	DEC_COD	DESCRIPTION	RESET	R/W

Note:

- 1) The HEX_COD is the hexadecimal address that the microcontroller has to generate to access the information.
- 2) RESERVED: register used for production test only, or for future use.

4.1 - STA013 REGISTERS DESCRIPTION

The STA013 device includes 128 I²C registers. In this document, only the user-oriented registers are described. The undocumented registers are reserved. These registers must never be accessed (in Read or in Write mode). The Read-Only registers must never be written.

The following table describes the meaning of the abbreviations used in the I²C registers description:

Symbol	Comment
NA	Not Applicable
UND	Undefined
NC	No Charge
RO	Read Only
WO	Write Only
R/W	Read and Write
R/WS	Read, Write in specific mode

VERSION

Address: 0x00

Type: RO

MSB				LSB			
b7	b6	b5	b4	b3	b2	b1	b0
V8	V7	V6	V5	V4	V3	V2	V1

The VERSION register is read-only and it is used to identify the IC on the application board.

IDENT

Address: 0x01

Type: RO

Software Reset: 0xAC

Hardware Reset: 0xAC

MSB				LSB			
b7	b6	b5	b4	b3	b2	b1	b0
1	0	1	0	1	1	0	0

IDENT is a read-only register and is used to identify the IC on an application board. IDENT always has the value "0xAC"

PLLCTL

Address: 0x05

Type: R/W

Software Reset: 0x21

Hardware Reset: 0x21

MSB

LSB

b7	b6	b5	b4	b3	b2	b1	b0
XTO_BUF	XTOD_IS	OCLK_EN	SYS2O_CLK	PPLD_IS	XTI2DS_PCLK	XTI2O_CLK	UPD_F_RAC

UPD_FRAC: when is set to 1, update FRAC in the switching circuit. It is set to 1 after autoboot.

XTI2OCLK: when is set to 1, use the XTI as input of the divider X instead of VCO output. It is set to 0 on HW reset.

XTI2DSPCLK: when is to 1, set use the XTI as input of the divider S instead of VCO output. It is set to 0 on HW reset.

PLLDIS: when set to 1, the VCO output is disabled. It is set to 0 on HW reset.

SYS2OCLK: when is set to 1, the OCLK frequency is equal to the system frequency. It is useful for testing. It is set to 0 on HW reset.

OCLKEN: when is set to 1, the OCLK pad is enable as output pad. It is set to 1 on HW reset.

XTODIS: when is set to 1, the XTO pad is disabled. It is set to 0 on HW reset.

XTO_BUF: when this bit is set, the pin nr. 28 (OUT_CLOCK/DATA_REQ) is enabled. It is set to 0 after autoboot.

PLLCTL (M)

Address: 0x06

Type: R/W

Software Reset: 0x0C

Hardware Reset: 0x0C

PLLCTL (N)

Address: 0x07

Type: R/W

Software Reset: 0x00

Hardware Reset: 0x00

The M and N registers are used to configure the STA013 PLL by DSP embedded software.

M and N registers are R/W type but they are completely controlled, on STA013, by DSP software.

REQ_POL

Address: 0x0C

Type: R/W

Software Reset: 0x01

Hardware Reset: 0x00

Hardware Reset: 0x01

The REQ_POL registers is used to program the polarity of the DATA_REQ line.

MSB				LSB			
b7	b6	b5	b4	b3	b2	b1	b0
0	0	0	0	0	0	0	1

Default polarity (the source sends data when the DATA_REQ line is high)

MSB				LSB			
b7	b6	b5	b4	b3	b2	b1	b0
0	0	0	0	0	1	0	1

Inverted polarity (the source sends data when the DATA_REQ line is low)

SCKL_POL

Address: 0x0D

Type: R/W

Software Reset: 0x04

Hardware Reset: 0x04

MSB				LSB			
b7	b6	b5	b4	b3	b2	b1	b0
X	X	X	X	X	0	0	0
					1	0	0

X = don't care

SCKL_POL is used to select the working polarity of the Input Serial Clock (SCKR).

- (1) If SCKL_POL is set to 0x00, the data (SDI) are sent with the falling edge of SCKR and sampled on the rising edge.
- (2) If SCKL_POL is set to 0x04, the data (SDI) are sent with the rising edge of SCKR and sampled on the falling edge.

ERROR_CODE

Address: 0x0F

Type: RO

Software Reset: 0x00

Hardware Reset: 0x00

MSB				LSB			
b7	b6	b5	b4	b3	b2	b1	b0
X	X	X	X	0	0	0	0
				0	0	0	1
				0	0	1	0

X = don't care

ERROR_CODE register contains the last error occurred if any. The codes can be as follows:

Code		Description
(1)	0x00	No error since the last SW or HW Reset
(2)	0x01	CRC Failure
(3)	0x02	DATA not available

SOFT_RESET

Address: 0x10

Type: WO

Head[11:10] sampling frequency index

Head[15:12] bitrate index

Head[16] protection bit

Head[18:17] layer

Head[19] ID

Head[20] ID_ex

The HEAD registers can be viewed as logically concatenated to store the MPEG Layer III Header content. The set of three registers is updated every time the synchronisation to the new MPEG frame is achieved

The meaning of the flags are shown in the following tables:

MPEG IDs

IDex	ID	
0	0	MPEG 2.5
0	1	reserved
1	0	MPEG 2
1	1	MPEG 1

Layer

in Layer III these two flags must be set always to "01".

Protection_bit

It equals "1" if no redundancy has been added and "0" if redundancy has been added.

Bitrate_index

indicates the bitrate (Kbit/sec) depending on the MPEG ID.

bitrate index	ID = 1	ID = 0
'0000'	free	free
'0001'	32	8
'0010'	40	16
'0011'	48	24
'0100'	56	32
'0101'	64	40
'0110'	80	48
'0111'	96	56
'1000'	112	64
'1001'	128	80
'1010'	160	96
'1011'	192	112
'1100'	224	128
'1101'	256	144
'1110'	320	160
'1111'	forbidden	forbidden

Sampling Frequency

indicates the sampling frequency of the encoded audio signal (KHz) depending on the MPEG ID

Sampling Frequency	MPEG1	MPEG2	MPEG2.5
'00'	44.1	22.05	11.03
'01'	48	24	12
'10'	32	16	8
'11'	reserved	reserved	reserved

Padding bit

if this bit equals '1', the frame contains an additional slot to adjust the mean bitrate to the sampling frequency, otherwise this bit is set to '0'.

Private bit

Bit for private use. This bit will not be used in the future by ISO/IEC.

Mode

Indicates the mode according to the following table. The joint stereo mode is intensity_stereo and/or ms_stereo.

mode	mode specified
'00'	stereo
'01'	joint stereo (intensity_stereo and/or ms_stereo)
'10'	dual_channel
'11'	single_channel (mono)

Mode extension

These bits are used in joint stereo mode. They indicate which type of joint stereo coding method is applied. The frequency ranges, over which the intensity_stereo and ms_stereo modes are applied, are implicit in the algorithm.

Copyright

If this bit is equal to '0', there is no copyright on the bitstream, '1' means copyright protected.

Original/Copy

This bit equals '0' if the bitstream is a copy, '1' if it is original.

Emphasis

Indicates the type of de-emphasis that shall be used.

emphasis	emphasis specified
'00'	none
'01'	50/15 microseconds
'10'	reserved
'11'	CCITT J,17

DLA

Software Reset: 0x03

Hardware Reset: 0x03

7	6	5	4	3	2	1	0
PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0

PCMDIVIDER is used to set the frequency ratio between the OCLK (Oversampling Clock for DACs), and the SCKT (Serial Audio Transmitter Clock).

The relation is the following:

$$\text{SCKT_freq} = \frac{\text{OCLK_freq}}{2 (1 + \text{PCM_DIV})}$$

The Oversampling Factor (O_FAC) is related to OCLK and SCKT by the following expression:

- 1) $\text{OCLK_freq} = \text{O_FAC} * \text{LRCKT_Freq}$
(DAC relation)
- 2) $\text{OCLK_Freq} = 2 * (1 + \text{PCM_DIV}) * 32 * \text{LRCKT_Freq}$ (when 16 bit PCM mode is used)
- 3) $\text{OCLK_Freq} = 2 * (1 + \text{PCM_DIV}) * 64 * \text{LRCKT_Freq}$ (when 32 bit PCM mode is used)
- 4) $\text{PCM_DIV} = (\text{O_FAC}/64) - 1$ in 16 bit mode
- 5) $\text{PCM_DIV} = (\text{O_FAC}/128) - 1$ in 32 bit mode

Example for setting:

MSB				LSB				Description	
b7	b6	b5	b4	b3	b2	b1	b0		
PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0		
0	0	0	0	0	1	1	1	16 bit mode	512 x Fs
0	0	0	0	0	1	0	1	16 bit mode	384 x Fs
0	0	0	0	0	0	1	1	16 bit mode	256 x Fs
0	0	0	0	0	0	1	1	32 bit mode	512 x Fs
0	0	0	0	0	0	1	0	32 bit mode	384 x Fs
0	0	0	0	0	0	0	1	32 bit mode	256 x Fs

for 16 bit PCM Mode

O_FAC = 512 ; PCM_DIV = 7

O_FAC = 256 ; PCM_DIV = 3

O_FAC = 384 ; PCM_DIV = 5

for 32 bit PCM Mode

O_FAC = 512 ; PCM_DIV = 3

O_FAC = 256 ; PCM_DIV = 1

O_FAC = 384 ; PCM_DIV = 2

PCMCONF**Address: 0x55**

Type: R/W

Software Reset: 0x21

Hardware Reset: 0x21

MSB				LSB				Description
b7	b6	b5	b4	b3	b2	b1	b0	
X	ORD	DIF	INV	FOR	SCL	PREC (1)	PREC (1)	
X	1							PCM order the LS bit is transmitted First
X	0							PCM order the MS bit is transmitted First
X		0						The word is right padded
X		1						The word is left padded
X			1					LRCKT Polarity compliant to I2S format
X			0					LRCKT Polarity inverted
X				0				I2S format
X				1				Different formats
X					1			Data are sent on the rising edge of SCKT
X					0			Data are sent on the falling edge of SCKT
X						0	0	16 bit mode (16 slots transmitted)
X						0	1	18 bit mode (18 slots transmitted)
X						1	0	20 bit mode (20 slots transmitted)
X						1	1	24 bit mode (24 slots transmitted)

PCMCONF is used to set the PCM Output Interface configuration:

ORD: PCM order. If this bit is set to '1', the LS Bit is transmitted first, otherwise MS Bit is transmitted first.

DIF: PCM_DIFF. It is used to select the position of the valid data into the transmitted word. This setting is significant only in 18/20/24 bit/word mode. If it is set to '0' the word is right-padded, otherwise it is left-padded.

INV (fig.13): It is used to select the LRCKT clock polarity. If it is set to '1' the polarity is compliant to I2S format (low -> left, high -> right), otherwise the LRCKT is inverted. The default value is '0'. (if I2S have to be selected, must be set to '1' in the STA013 configuration phase).

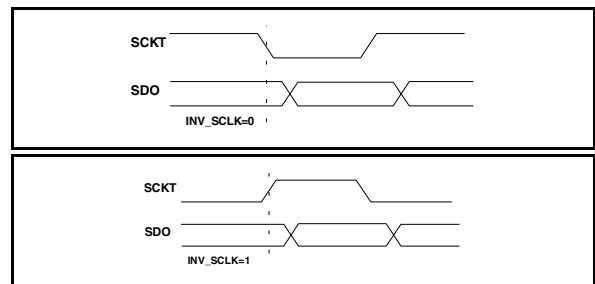

Figure 13. LRCKT Polarity Selection

FOR: FORMAT is used to select the PCM Output Interface format.

After hw and sw reset the value is set to 0 corresponding to I²S format.

SCL (fig.14): used to select the Transmitter Serial Clock polarity. If set to '1' the data are sent on the

rising edge of SCKT and sampled on the falling. If set to '0', the data are sent on the falling edge and sampled on the rising. This last option is the most commonly used by the commercial DACs. The default configuration for this flag is '0'.

Figure 14. SCKT Polarity Selection**PREC [1:0]: PCM PRECISION**

It is used to select the PCM samples precision, as follows:

'00': 16 bit mode (16 slots transmitted)

'01': 18 bit mode (32 slots transmitted)

'10': 20 bit mode (32 slots transmitted)

'11': 24 bit mode (32 slots transmitted)

The PCM samples precision in STA013 can be 16 or 18-20-24 bits.

When STA013 operates in 16 (18-20-24) bits mode, the number of bits transmitted during a LRCKT period is 32 (64).

X	X	X	X	X	X	1	0	Right channel is duplicated on both Output channels
X	X	X	X	X	X	1	1	Right and Left channels are toggled

The default configuration for this register is '0x00'.

ANCILLARY DATA BUFFER**Address: 0x59 - 0x5D**

Type: RO

Software Reset: 0x00

Hardware Reset: 0x00

STA013 can extract max 56 bytes/MPEG frame. To know the number of A.D. bits available every MPEG frame, the ANCCOUNT_L and ANCCOUNT_H registers (0x41 and 0x42) have to be read.

The buffer dimension is 5 bytes, written by STA013 core in sequential order. The timing information to read the buffer can be obtained by reading the FRAME_CNT registers (0x67 - 0x69).

To fill up the buffer with a new 5-bytes slot, the STA013 waits until a CMD_INTERRUPT register is written by the master.

MFSDF (X)**Address: 0x61**

Type: R/W

Software Reset: 0x07

Hardware Reset: 0x07

MSB				LSB			
b7	b6	b5	b4	b3	b2	b1	b0
X	X	X	M4	M3	M2	M1	M0

The register contains the values for PLL X divider (see Fig. 7).

The value is changed by the internal STA013 Core, to set the clocks frequencies, according to the incoming bitstream. This value can be even set by the user to select the PCM interface configuration.

The VCO output frequency is divided by (X+1).

This register is a reference for 32KHz and 48 KHz input bitstream.

DAC_CLK_MODE**Address: 0x63**

Type: RW

Software Reset: 0x00

Hardware Reset: 0x00

MSB				LSB			
b7	b6	b5	b4	b3	b2	b1	b0
X	X	X	X	X	X	X	MODE

This register is used to select the operating mode for OCLK clock signal.

If it is set to '1', the OCLK frequency is fixed, and it is maintained to the value fixed by the user even if the sampling frequency of the incoming bitstream changes.

If the MODE flag is set to '0', the OCLK frequency changes, and can be set to $(512, 384, 256) \cdot F_s$. The default configuration for this mode is $256 \cdot F_s$.

When this mode is selected, the default OCLK frequency is 12.288 MHz.

PLLFRAC_L ([7:0])

Signed number (2 complement)

This register is used to select the enhancement or attenuation STA013 has to perform on Treble Frequency range at the digital signal.

A decrement (increment) of a decimal unit corresponds to a step of attenuation (enhancement) of 1.5dB.

The allowed Attenuation/Enhancement range is [-18dB, +18dB].

In the digital output audio, the full signal is achieved with 0 dB of attenuation. For this reason, before applying Bass & Treble Control, the user has to set the TONE_ATTEN register to the maximum value of enhancement is going to perform.

For example, in case of a 0 dB signal (max. level) only attenuation would be possible. If enhancement is desired, the signal has to be attenuated accordingly before in order to reserve a margin in dB. An increment of a decimal unit corresponds to a Tone Attenuation step of 1.5dB.

5. GENERAL INFORMATION

5.1. MPEG 2.5 Layer III Algorithm.

5.2 - MPEG Ancillary Data Description:

As specified in the ISO standard, the MPEG Layer III frames have a variable bit length, and are constant in time depending on the audio sam-

pling frequencies. The time duration of the Layer III frames is shown in Tab 2.

Table2: MPEG Layer III Frames Time Duration

Sampling Frequency (KHz)	48	44.1	32	24	22.5	16	12	11.025	8
MPEG Frame Length (ms)	24	29	36	24	29	36	48	48	72

STA013 - STA013B - STA013T

The Ancillary Data extraction on STA013 can be described as follow:

STA013 has a specific Ancillary Data buffer, mapped into the I2C registers:

0x59	ANC_DATA_1
0x5A	ANC_DATA_2
0x5B	ANC_DATA_3
0x5C	ANC_DATA_4
0x5D	ANC_DATA_5

Since the content of Ancillary Data into an MPEG Frame STA013 can extract is max. 56 bytes, a

specific register, to require the new 5 byte slot to STA003 is needed.

This register is:

0x16	CMD_INTERRUPT
------	---------------

The interrupt register, is sensitive to any non-zero value written by the Microcontroller. When this register is updated the Ancillary Data buffer is filled up with new values and the registers

0x41	ANCCOUNT_L
0x42	ANCCOUNT_H

are updated (decremented) accordingly.

5.3. I/O CELL DESCRIPTION

1) CMOS Tristate Output Pad Buffer, 4mA, with Slew Rate Control / Pin numbers 9, 10, 11, 20, 28

OUTPUT PIN	MAX LOAD
Z	100pF

2) CMOS Bidir Pad Buffer, 4mA, with Slew Rate Control / Pin numbers 3, 12

OUTPUT PIN	CAPACITANCE	OUTPUT PIN	MAX LOAD
IO	5pF	IO	100pF

3) CMOS Input Pad Buffer / Pin numbers 4, 5, 6, 8, 21, 25

INPUT PIN	CAPACITANCE
A	3.5pF

4) CMOS Input Pad Buffer with Active Pull-Up / Pin numbers 7, 24, 26

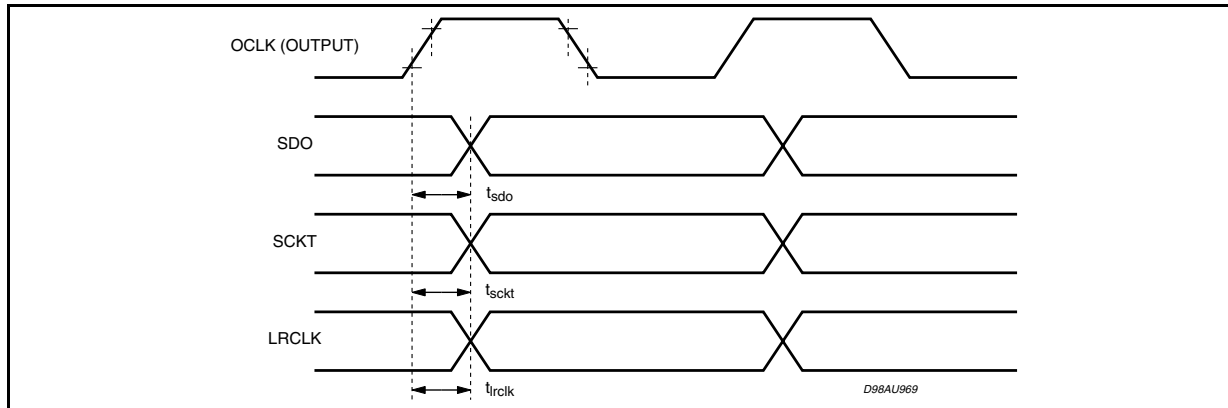

INPUT PIN	CAPACITANCE
A	3.5pF

5.4. TIMING DIAGRAMS

5.4.1. Audio DAC Interface

a) OCLK in output. The audio PLL is used to clock the DAC

$$t_{sdo} = 3.5 + \text{pad_timing}(\text{Cload_SDO}) - \text{pad_timing}(\text{Cload_OCLK})$$

$$t_{sckt} = 4 + \text{pad_timing}(\text{Cload_SCKT}) - \text{pad_timing}(\text{Cload_OCLK})$$

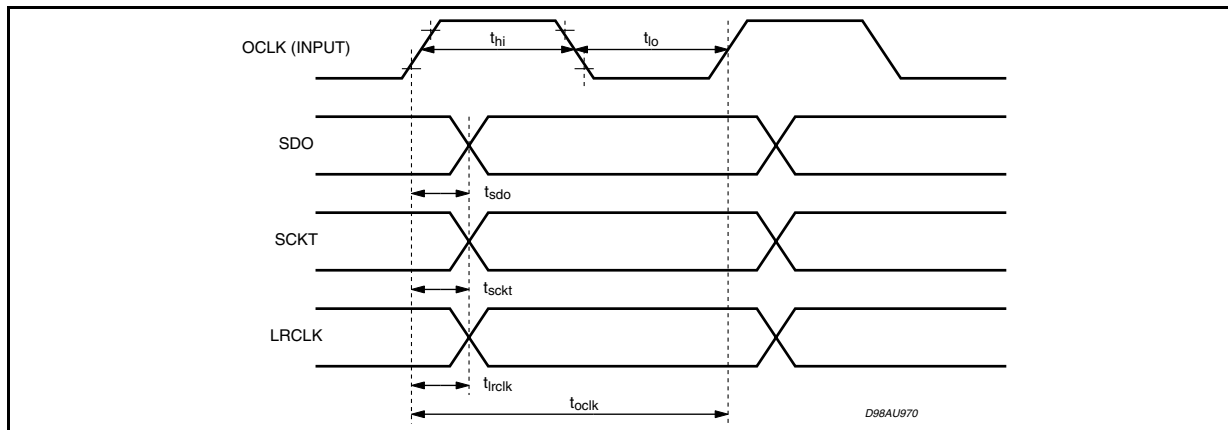

$$t_{lrckt} = 3.5 + \text{pad_timing}(\text{Cload_LRCKT}) - \text{pad_timing}(\text{Cload_OCLK})$$

Pad-timing versus load

Load (pF)	Pad_timing
25	2.90ns
50	3.82ns
75	4.68ns
100	5.52ns

Cload_XXX is the load in pF on the XXX output.
pad_timing (Cload_XXX) is the propagation delay added to the XXX pad due to the load.

b) OCLK in input.

$$t_{hi} \text{ min} = 3\text{ns}$$

$$t_{lo} \text{ min} = 3\text{ns}$$

$$t_{oclk} \text{ min} = 25\text{ns}$$

$$t_{sdo} = 5.5 + \text{pad_timing}(\text{Cload_SDO}) \text{ ns}$$

$$t_{sckt} = 6 + \text{pad_timing}(\text{Cload_SCKT}) \text{ ns}$$

$$t_{lrckt} = 5.5 + \text{pad_timing}(\text{Cload_LRCKT}) \text{ ns}$$

5.4.2. Bitstream input interface (SDI, SCKR, BIT_EN) SCL_POL = 0

5.4.2. Bitstream input interface (SDI, SCKR, BIT_EN) SCL_POL = 1

$t_{sdi_setup_min} = 2ns$

$t_{sdi_hold_min} = 3ns$

$t_{sckr_min_hi} = 10ns$

$t_{sckr_min_low} = 10ns$

$t_{sckr_min_lperiod} = 50ns$

$t_{biten} (min) = 2ns$

5.4.3. SRC_INT

This is an asynchronous input used in "broadcast" mode.

SRC_INT is active low

t_{src_low} min duration is 50ns (1DSP clock period)

t_{src_high} min duration is 50ns (1DSP clock period)

5.4.4. XTI,XTO and CLK_OUT timings

$t_{xto} = 1.40 + pad_timing (Cload_XTO) ns$

$t_{clk_out} = 4 + pad_timing (Cload_CLK_OUT) ns$

Note: In "multimedia" mode, the CLK_OUT pad is DATA_REQ. In that case, no timing is given between the XTI input and this pad.

5.4.5. RESET

The Reset min duration ($t_{\text{reset_low_min}}$) is 100ns

5.6. STA013 CONFIGURATION FILE FORMAT

The STA013 Configuration File is an ASCII format. An example of the file format is the following:

```
58  1
42  4
128 15
.....
```

It is a sequence of rows and each one can be interpreted as an I²C command.

The first part of the row is the I²C address (register) and the second one is the I²C data (value).

To download the STA013 configuration file into the device, a sequence of write operation to STA013 I²C interface must be performed.

The following program describes the I²C routine to be implemented for the configuration driver:

STA013 Configuration Code (pseudo code)

download cfg - file

```
{
  fopen (cfg_file);
  fp:=1;                                /*set file pointer to first row */

  do {
    I2C_start_cond;                      /* generate I2C start condition for STA013 device address */
    I2C_write_dev_addr;                  /* write STA013 device address */
    I2C_write_subaddress (fp);           /* write subaddress */
    I2C_write_data (fp);                 /* write data */
    I2C_stop_cond;                       /* generate I2C stop condition */
    fp++;                                /* update pointer to new file row */
  }
  while (!EDF)                           /* repeat until End of File */
}                                          /* End routine */
```

Note:1

STA013 is a device based on an integrated DSP core. Some of the I2C registers default values are loaded after an internal DSP boot operation. The bootstrap time is 60 micro second. Only after this time lenght, the data in the register can be considered stable.

Note 2:
